Test Plan: Amazon Pay Balance Functionality

Project Name: Amazon Pay Balance (Wallet and Gift Card)
Version: 1.0
Date: 11-02-2026
Platform: amazon.in web

Disclaimer:

- All the Section mentioned below are mandatory and should not be deleted.
- In case if any section is not applicable for your project, mark it as NA
- This is a standard template which cover important and mandatory section of the plan, please do not restrict yourself only with these and based on Requirement feel free to add more section or sub section in your Test Plan.

1.Introduction

Amazon Pay balance can be added to an account in two ways: through the wallet or via gift card redemption. Wallet money can be added by the user themselves or by a known person with access to the account, and it can be used for Amazon shopping, merchant payments, or sent to friends/family only if the user's bank account is linked; otherwise, transfers are not allowed. Gift card balance, received as a gift, can be redeemed using the gift card code, after which it is added to the wallet and can be used for shopping or merchant payments, but cannot be sent to friends or family members. Once money is added via wallet or gift card, the Amazon Pay balance shows the amounts separately (e.g., Wallet: ₹200, Gift Card: ₹4000) along with the total balance (Amazon Pay Balance: ₹4200).

1.1 Acceptance Criteria

- The user should be able to add money to the Amazon Pay wallet after successful login.
- The user should be able to redeem a gift card using a valid gift card code.
- The user should be able to use the available wallet balance (including redeemed gift card balance) for: Amazon shopping, Merchant payments
- The user should not be able to transfer or send gift card balance to friends or family members. Gift card balance must be restricted to shopping and merchant payments only.
- The user should be able to send money to friends or family members using wallet balance, subject to applicable conditions (e.g., bank account linking, if supported).
- If a guest user attempts to add money to the wallet without logging in, the system should redirect the user to the login page.
- Only authenticated (logged-in) users should be able to add money to the wallet.
- If another person has valid access to the user's Amazon account and is logged in, they should be able to add money to the wallet.
- When money is added through wallet top-up, the amount should be stored under the Wallet Balance section and gift card is redeemed, the amount should be stored under the Gift Card Balance section.
- When a purchase is made:
    - If the amount is deducted from Gift Card balance, it should reduce only the Gift Card balance and update the Amazon Pay Balance (total) accordingly.
    - If the amount is deducted from Wallet balance, it should reduce only the Wallet balance and update the Amazon Pay Balance (total) accordingly.
- After every transaction (top-up, redemption, payment), the individual balances and total balance must be updated accurately and stored correctly in the system.
- If the user has insufficient wallet or gift card balance while making a purchase, the system should prompt the user to add money to the wallet and allow the user to complete the payment after successful top-up

2.Scope

- Add money to wallet
- Redeem gift card
- Balance display (Wallet, Gift Card, Amazon Pay Balance)
- Deduction logic during shopping
- Transfer wallet money (if supported)
- Login validation before wallet access
- Error handling for invalid gift card

2.1 In Scope

Form Factor Coverage –

Form Factor	Applicable?
Android	☑
iOS	☐
mWeb	☐
Desktop	☑

2.2 Out of Scope

- Bank-side transaction failures
- Refund Process
- Transaction History
- Add Cash to Balance (Cash on Delivery / offline flow)

3.Test Strategy

3.1 Test Strategy Checklist

Test Type	Applicable
Functional Testing	☑
Monkey Testing	☑
Performance Testing	☑
Localization Testing	☑
Regression Testing	☑
Compatibility Testing	☑

3.1.1 Test Strategy Detail

- **Functional Testing:** Functional testing of the Amazon Pay balance includes not only positive test scenarios but also negative testing, boundary value testing, and edge case validation for both Wallet and Gift Card features. This ensures that valid transactions such as adding money to the wallet, redeeming gift cards, and making payments work correctly, while invalid scenarios like incorrect gift card codes, expired vouchers, insufficient balance, and unauthorized access are handled gracefully with proper error messages. Boundary and edge cases such as minimum and maximum add-money limits, zero balance conditions, partial payments, and transaction failures are also verified to ensure system stability, data accuracy, and a reliable user experience across all wallet and gift card operations.

- **Monkey Testing:** Monkey testing will be performed to validate the stability of the Amazon Pay wallet and gift card UI by executing random user actions such as clicking buttons, navigating between pages, entering random inputs, and interrupting payment flows to ensure the application does not crash and handles unexpected behaviour gracefully.

- **Performance testing:** Performance testing will be conducted for the Amazon Pay balance features to evaluate system responsiveness, stability, and scalability under normal and peak load conditions. This includes measuring response time and latency for critical user journeys such as adding money to the wallet, redeeming gift cards, viewing balance breakdown (Wallet vs Gift Card), and completing merchant payments. Load and stress scenarios will be executed to ensure the system can handle concurrent users and high transaction volumes without degradation, while monitoring failures, timeouts, and graceful error handling during network or payment gateway delays.

- **Localization Testing:** Localization testing will be performed for the Amazon Pay features to ensure the application correctly supports different languages, regions, currencies, date/time formats, and cultural conventions. This includes validating translated UI text for Wallet and Gift Card flows, correct currency symbols and formatting for balances and transactions, proper display of numbers and decimal separators, and region-specific content such as payment options and error messages. The goal is to ensure users across supported locales have a consistent, accurate, and user-friendly experience without functional or UI issues.

- **Regression Testing:** Regression testing will be performed for the Amazon Pay balance features to ensure that new changes, bug fixes, or enhancements do not break existing functionalities such as adding money to the wallet, redeeming gift cards, balance calculation (Wallet vs Gift Card vs Amazon Pay Balance (Total)), and merchant payments. Critical user flows and previously fixed defects will be re-validated across web and mobile platforms. A regression suite will be maintained and executed for every release, with stable scenarios automated where feasible and complex payment or external dependency flows validated manually to ensure end-to-end stability.

- **Compatibility Testing:** Compatibility testing will be conducted for the Amazon Pay features to ensure consistent behaviour and UI across different platforms, devices, browsers, operating systems, and screen resolutions. This includes validating Wallet and Gift Card flows on major web browsers (Chrome, Firefox, Edge) and on mobile devices across supported Android and iOS versions. The application should function correctly with different network conditions and device configurations, ensuring a seamless and reliable user experience for all supported environments.

3.1.2 TEST COVERAGE

OS Coverage

	A	B
1	**Priority**	**Operating System**
2	**P0**	Windows
3	**P1**	Android 15

3.2 Automation Plan

UI Automation Strategy / Approach

- Automate critical user journeys
- Focus on smoke and sanity tests
- Page Object Model (POM) design pattern
- Cross-platform execution (Web & Android)

Packages/Libraries

- Selenium WebDriver 4.23.0
- TestNG 7.11.0

Functionality	Priority	E2E Coverage
Amazon Pay -> Add Money -> Enter Amount -> Add money to Wallet -> Select Payment Method -> payment ->Successful Payment (Happy path)	P0	Yes
Amazon Pay -> Enter Gift Card code -> Add gift card to balance (Happy path)	P0	Yes
Payment failure flow	P0	Yes
Smoke test suite (critical scenarios)	P0	Yes

Note: E2E testing covers complete user flows from bill selection to payment confirmation. Partial coverage means individual features tested but not full E2E.

3.3 Test Environments

Environments	Purpose	User Accounts	Data Type	Access
Dev	Development and Dev Testing	Mock only	Synthetic (Fake)	VPN
QA/Beta	Maintain Testing Environment	Mock + limited real accounts	Test Data	VPN
Pre-Prod/Gamma	UAT & final Validation	Limited real accounts	Sanitized Prod Data	VPN
Production	Live Environment	All Live Accounts	Live Data	Public

3.4 Test Data

1. **Test Data – Add Money Amount Field**
   - **Valid Data:** 1, 786, 10000
   - **Invalid Numeric Data:** -1, -788, 0
   - **Boundary Values:** Max limit (e.g:100000), Above max (e.g:100001), Min limit (e.g:1)
   - **Special Characters:** %$%$*&^
   - **Alphabetic Input:** ABHG

2. **Test Data – Add Money Amount Field**
   - **Valid Data:** WU56WTT9KVCGH5
   - **Invalid Data:** jhvgyfghbgfh
   - **Alphabetic Data:** FDERRKHYUTURJGB
   - **Numeric Data:** 76978745327455
   - **Empty Input:** (blank)
   - **Special Characters:** ^&^%%^%*T*(
   - **Expired Code:** (use an expired test gift card code)

Account Type	UserName	Purpose
Regular	testuser1@example.com	Verify login, add money, redeem gift card, and complete shopping/payment.
Prime	primeuser@example.com	Verify login, add money, redeem gift card, and complete shopping/payment.
Guest	--	Verify redirection to login page when accessing Amazon Pay features

3.5 Test Scenarios

No	Module	Use Case	Remark
1	Amazon Pay	Validate navigation to Amazon Pay page from Home page	Functional, Positive Test
2	Amazon Pay	Validate Add Money and Gift Card options under Amazon Pay balance section	Functional, Positive Test
3	Amazon Pay	Validate navigation to Add Money page from Amazon Pay home page	Functional, Positive Test
4	Amazon Pay	Validate navigation to Gift Card page from Amazon Pay home page	Functional, Positive Test
5	Amazon Pay	Validate adding money to Wallet	Functional, Positive Test
6	Amazon Pay	Validate redeeming Gift Card to balance	Functional, Positive Test
7	Amazon Pay	Validate total balance calculation and display	Functional, Positive Test
8	Amazon Pay	Validate Wallet and Gift Card balances under Total Balance	Functional, Positive Test
9	Amazon Pay	Validate navigation to Add Gift Card page from “Do more with Amazon Pay Balance” section	Functional, Positive Test
10	Amazon Pay	Validate navigation to Amazon Pay Balance page from “Add Money” section	Functional, Positive Test
11	Amazon Pay	Validate Amazon Pay page content updates correctly after changing the site language on Amazon.in	Functional, Localization Test

3.6 Test Cases

- Verify clicking on Amazon Pay in the navigation bar navigates to Amazon Pay home page
- Verify Amazon Pay Balance with total amount is visible on Amazon Pay home page
- Verify (+) Add Money option is visible under Amazon Pay Balance section
- Verify (+) icon is non-clickable and Add Money text is clickable
- Verify clicking on Add Money navigates to Amazon Pay Balance page
- Verify Total Balance displays sum of Wallet and Gift Card balances with ₹ symbol
- Verify Wallet and Gift Card balances are displayed below Total Balance with ₹ symbol
- Verify Add Money textbox is highlighted in light blue on focus
- Verify default amount (₹1000) is displayed in the Add Money textbox
- Verify placeholder text “Enter Amount” is displayed when textbox is empty
- Verify error message is shown for invalid input (alphabets, special characters)
- Verify suggestion chips [+₹500], [+₹1000], [+₹1500] are displayed below textbox
- Verify clicking suggestion adds amount to textbox and updates limit message
- Verify suggestion chips are disabled when limit is exceeded
- Verify error message and red border appear when amount exceeds limit
- Verify Add Money button is disabled when textbox is empty
- Verify “Do more with Amazon Pay Balance” section is visible on the right side
- Verify clicking “Add Gift Card to Balance” navigates to Gift Card page
- Verify Amazon Pay Balance page is displayed in the selected language after changing the site language
- Verify UI labels and messages on Amazon Pay pages change according to the selected language
- Verify guest user is redirected to login page when Accessing the Amazon Pay balance
- Verify navigation to Amazon Pay Gift Card page from Amazon Pay home page
- Verify Gift Card page loads successfully for logged-in user
- Verify Gift Card code input field is visible
- Verify Redeem/Add to Balance button is visible and enabled for valid input
- Verify user can redeem a valid Gift Card code successfully
- Verify redeemed Gift Card amount is added to Gift Card balance
- Verify Total Balance is updated after successful Gift Card redemption
- Verify success message is displayed after redeeming Gift Card
- Verify Gift Card balance is reflected under Total Balance section
- Verify Gift Card balance can be used for shopping/merchant payments
- Verify error message is displayed for invalid Gift Card code
- Verify error message is displayed for expired Gift Card code
- Verify error message is displayed for already-used Gift Card code
- Verify error message is displayed when Gift Card code field is empty
- Verify error message is displayed for special characters in Gift Card code field
- Verify Redeem button is disabled when Gift Card code field is empty
- Verify guest user is redirected to login page when accessing Gift Card page
- Verify only logged-in users can redeem Gift Cards
- Verify Gift Card input field highlights on focus
- Verify placeholder text is displayed in Gift Card code input field
- Verify error message is displayed in red colour for invalid Gift Card code
- Verify success message is displayed in appropriate colour after successful redemption
- Verify Gift Card balance cannot be transferred to friends/family
- Verify Gift Card balance cannot be withdrawn to bank account
- Verify Gift Card redemption history is updated in transaction history
- Verify Testing in Microsoft Edge browser

3.7 Defects

4. Assumptions and Dependencies

Assumptions:

- Test environment is available and stable
- Test user accounts (regular/prime) are pre-created
- Valid and invalid gift card codes are available
- Requirements and UI are frozen before test execution

Dependencies:

- Build deployment from Dev team
- Backend APIs and payment services availability
- Test data setup from DB/Dev team
- VPN access for QA environment

5. Risks and Contingencies

Risks:

- Unstable QA environment may block testing
- Delayed build delivery from Dev team
- External payment service downtime
- Last-minute requirement changes
- Unstable build from the Dev team

Contingencies:

- Use mock services or alternate environment
- Execute smoke tests first when build is delayed
- Test core flows using stubs if payment service is down
- Prioritize P0 scenarios if scope changes

6 Test Deliverables

S.No.	Deliverable Name	Author	Reviewer
1	Test Strategy and Test Plan	QAE@	QA Team, QAM,Dev Team/SDM
2	Test Cases	QAE@	QA Team/Dev Team/PM
3	Test Data	QAE@/PM@	QAM/SDE/SDM/PM/TPM
4	API Testing & IN-Sprint planned automation	QAE@	
5	First Test pass	QAE@	
6	Daily status report (including bug reports)	QAE@	QAM/SDM/TPM/PM/SDE/Clients QA if any
7	Defect Fix by Dev	SDE@	
8	Production Sanity	QAE@	
9	Defect Validation	QAE@	
10	Sanity & Sign-Off	QAE@	QAM/SDM/TPM/PM/SDE
11	Create sanity cases if required and update on the Intake	QAE@	
12	Share Quality metric	QAE@	QAM/SDM/TPM/PM/SDE
13	Client QA Sign Off		

7 Dev Build Plan

Build Version	ETA	Notes

8 QA Acceptance/Entry Criteria

Criteria	Status	Comment and ETA
Developer to Execute BVT Cases before build drop BVT List - here		
Developer to document and share all Code Review feedback in Quip, with descriptions of the associated functional changes and coverage		
All the Open Questions are addressed		

Weblab detail with access in place		

9 QA Exit Criteria

Task	Status	Comment and ETA
100 % Test cases Executed.		
100% Test Strategy is covered and completed		
All open issue are triaged and got alignment to differ.		
Planned Automation completed		
All the Open Bugs are triaged and have Product alignment		
Client Sign off are in place (If Applicable)		
Test Rail is updated		

10 Open Questions

Mention all the Open questions present during the design/development/review & execution phases.

- Parent sim containing all the issues
- Track any outstanding issues, owner for follow up and status. This list typically represents QA questions that are not answered yet.

11 Effort Estimation / person

Task Name	Ownership	Start Time	Finish Time	Status	Comments(If any)
Requirement Understanding					
Test Planning					
Test cases writing					
Test plan Review					
Test Data collection if required					
Planned buffer					
First Pass completion					
Bug creation, Retest the bug and Triage					
Retest the failed cases and Sanity					
Any test planned to test in prod
